Health Psychology

Seminar 2: Health Promotion

Date

Recap Seminar 1

What does it mean to be healthy?

Definitions of health and well-being

Travis's Illness-Wellbeing Continuum

Introduction to theoretical models:

Biopsychosocial model

Social Cognition Models

Aims of the seminar

This week's seminar is designed to introduce you to the topic of **health promotion**. We will consider why health promotion is so important to improving health in individuals, communities and across populations. We will also develop a critical awareness of the impact of **individual differences** in the perception of illness, health behaviours, health attitudes and health outcomes.

You should prepare in advance for these discussions using information from the core textbooks and recommended reading.

This week we will **test your knowledge on:**

1. Health promotion campaigns. What are the key factors which might influence your participation?
2. Individual differences in health promotion. How might an individual's circumstances impact on their health outcomes?

What is health promotion?

‘Health promotion is the process of enabling people to increase control over, and to improve, their health. It moves beyond a focus on individual behaviour towards a wide range of social and environmental **interventions**’ (WHO, 1984, page 4)

‘Making healthy choices’ (Milio, 1986, as cited in Rodham, 2010 page 52)

‘Health promotion is concerned with finding healthy ways to encourage health behaviours’ (Rodham, 2010, page 51)

Question 1

Think about your experience. What are the key factors that might influence your participation in a health promotion campaign?

Some questions to consider ...

What would encourage/prevent me from engaging with a health campaign?

What are my thoughts/feelings about it?

Are any of my friends engaged with the campaign?

How will it benefit me?

How easy will it be?

Do I have the willpower..?

Can I fit it into my busy routine..?

Message framing and health behaviours

Message framing refers to the emphasis in the message on positive or negative consequences of adopting or failing to adopt a particular behaviour

Gain frame:

“Wearing a mask in public places can help to keep yourself and others safe...”

Loss frame:

“Failing to wear a mask in public places puts yourself and others at risk ..”

Approaches to health promotion

Behaviour change
approach

Self-empowerment
approach

The community
development

BRIEF REPORT

Theory-based Behavioral Predictors of Self-reported Use of Face Coverings in Public Settings during the COVID-19 Pandemic in the United States

Published online: 10 December 2020

Published by Oxford University Press on behalf of the Society of Behavioral Medicine 2020. This work is written by (a) US Government employee(s) and is in the public domain in the US.

Abstract

Background Investigating antecedents of behaviors, such as wearing face coverings, is critical for developing strategies to prevent SARS-CoV-2 transmission.

Purpose The purpose of this study was to determine associations between theory-based behavioral predictors of intention to wear a face covering and actual wearing of a face covering in public.

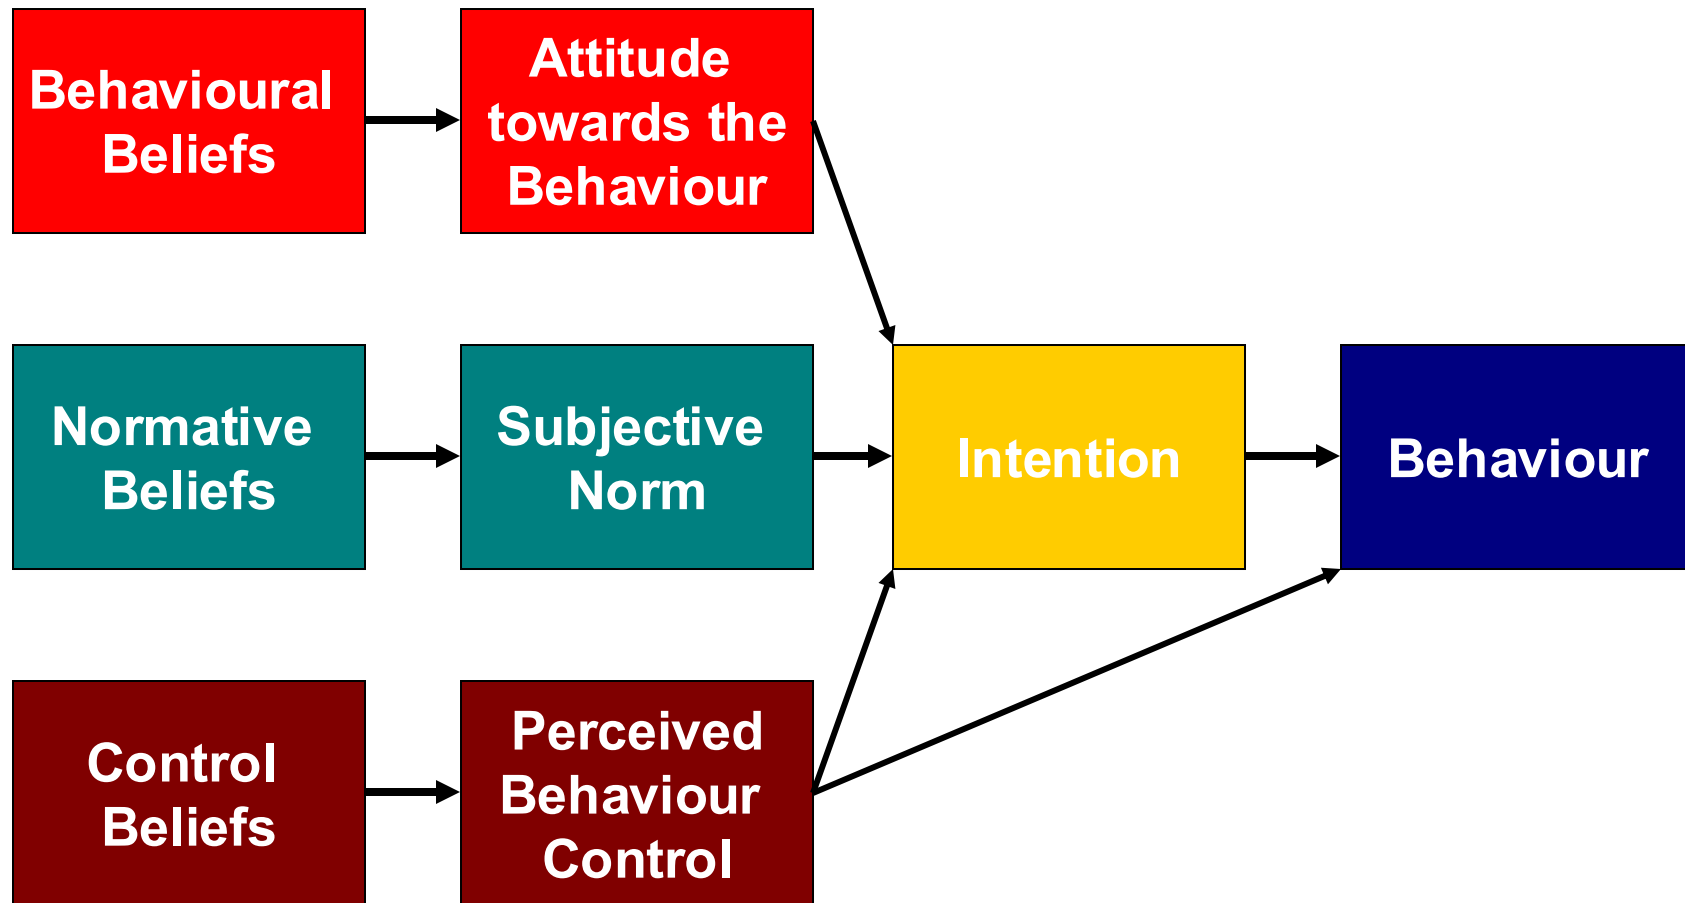

Methods Data from a cross-sectional panel survey of U.S. adults conducted in May and June 2020 ($N = 1,004$)

Results We found that being female, perceived importance of others wanting the respondent to wear a face covering, confidence to wear a face covering, and perceived importance of personal face covering use was positively associated with intention to wear a face covering in public. Intention to wear a face covering was positively associated with self-reported wearing of a cloth face covering if other people were observed wearing cloth face coverings in public at least “rarely” (aOR = 1.43), with stronger associations if they reported

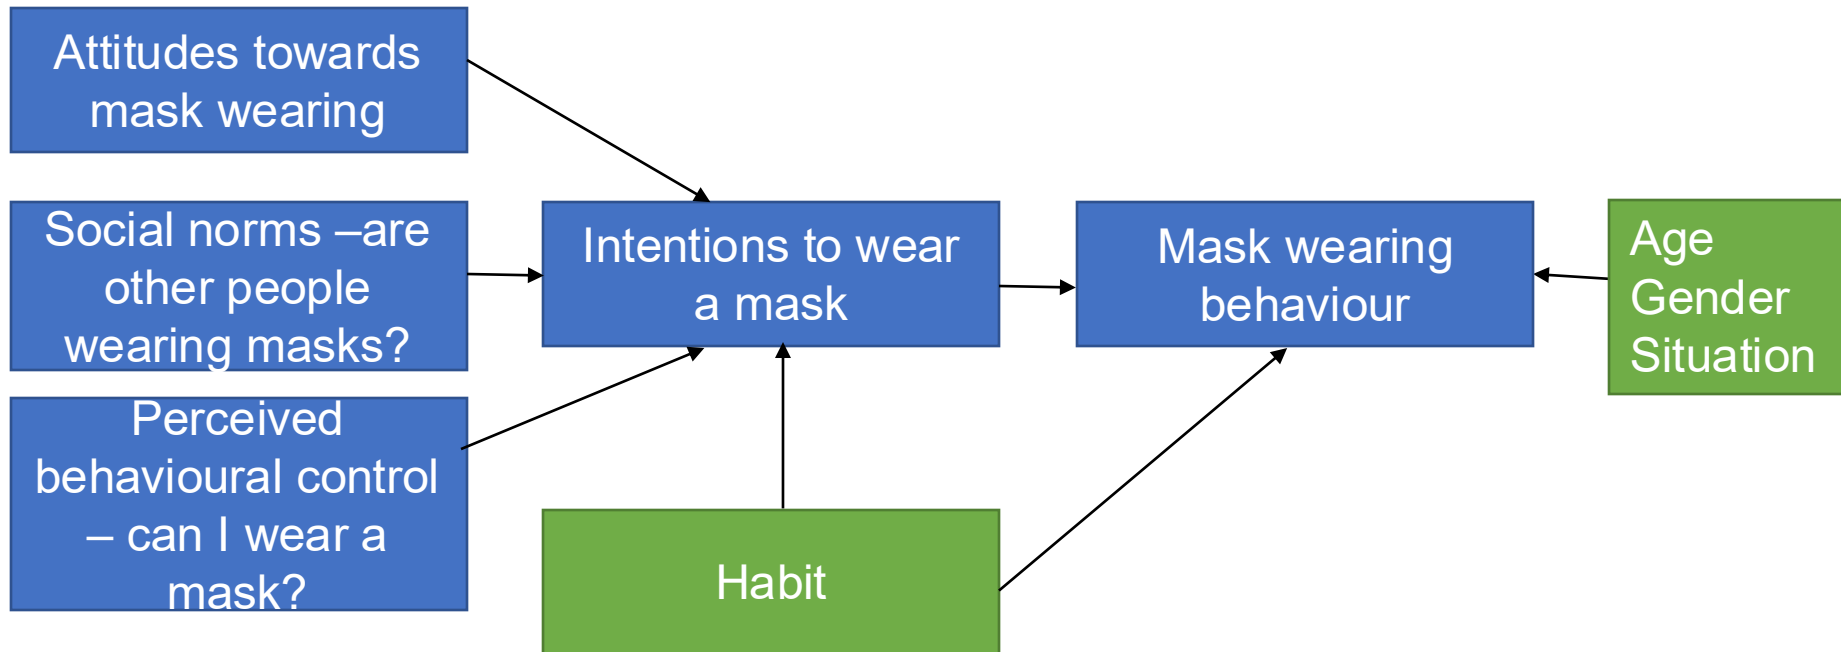

Theory of Planned Behaviour

Azjen, (1985)

Example

CRITIQUE: The theory of planned behaviour doesn't account for habit.

Question 2

How might an individual's circumstances impact on their health outcomes?

Individual differences

Consider factors which influence health behaviour

Demographics: Age, gender, environment

Socio-economic factors

Resilience/coping

Core health beliefs (influenced by culture)

Locus of control

Knowledge and expectations

Health inequalities

Personality factors in health and illness

Personality and Health

Traits associated with negative health outcomes

Neuroticism

Hostility (a key variable of Type A personality)

Traits associated with positive health outcomes

Conscientiousness

Extraversion

Optimism

Less research evidence relating openness or agreeableness to health outcomes, although some researchers view hostility as low agreeableness; (Abraham et al., 2008).

Unit 1

Unit 2

Unit 3

Unit 4

Unit 5

Unit 6

Unit 7

Follow up response: In the second part of the assessment you must critically respond to two of your peers' posters. Your responses should draw on theories of critical thinking and learning, and focus on the content of their posters and executive summaries, not just the poster design. You should aim to post 200 words per response.

Instructions

- Design a theory led health promotion poster.
- Attach the health promotion poster to a new forum discussion accompanied by a 500-word executive summary.
- Respond to two of your peer's posters (200 words per response).
- Your answers must use an academic tone, be **evidence-based** and supported by the psychological literature, using **APA referencing**.
- This collaborative learning activity lasts for **two weeks**. It starts at the beginning of **Unit 3** and finishes at the end of **unit 4**.
- Your **initial response must be posted within the first week** (unit 3), and your **two follow-up responses must be posted by the end of the second week** (unit 4).

Please note:

- The collaborative learning question will remain open for 2 weeks.
- Any responses added after the deadline will not be assessed.
- You must submit **all three posts** to pass this assessment.
- You will be assessed on your contribution to this 2-week activity at the end of unit 4.
- All responses must be referenced correctly using APA referencing and acknowledge all sources of information used to back up your ideas.
- This assessment cannot be blind marked due to the active participation of our tutors within the discussions.

Please note, a word count penalty applies to this assessment.

How to approach the CLQ task

Brief introduction to selected topic and theory chosen

Explain the aim of the poster, for example, why is it needed?

Explain each part of the poster in relation to theory constructs and provide a strong rationale for inclusion:

e.g., 'The subjective norms component of the TPB is illustrated by the image/statement.....'

Bring in a few examples of research studies which have used similar models and interventions

Be critical. Remember Social Cognition Models are not perfect.

Questions

How to use research for the poster assignment

How to format the models/theories to explain the poster

How to format the executive summary

Do I need to use references for the poster and summary?

Are the poster and summary equally graded?

Is there a word limit for the poster?

Are we able to use images from Google images (e.g.) for the poster?

Critical thinking skills

Descriptive writing	Critical analytical writing
States what happened	Identifies the significance
States what something is like	Evaluates strengths and weaknesses
Gives the story so far	Weights one piece of information against another
Outlines the order in which things happened	Makes reasoned judgements
Instructs how to do something	Argues a case according to the evidence
Lists the main elements of a theory	Shows why something will work (best)
Notes the methods used	Identifies whether something is appropriate or suitable
States when something occurred	Identifies why the timing is of importance
States the different components	Weights up the importance of component parts
States options	Gives reasons for selecting each option
Lists details	Evaluates the relative significance of details
Lists in any order	Structures information in order of importance
States links between items	Shows the relevance of links between pieces of information
Gives information or report's findings	Evaluates information and draws conclusions

Any questions?

Check your understanding

Question 1:

What are the key factors which might influence your participation in a health promotion campaign?

What are my thoughts and feelings about it?

How will it benefit me?

Do I have the willpower?

Can I fit it into my schedule?

Are any of my friends engaged with the campaign?

Check your understanding

Question 2:

How might an individual's circumstances impact on their health outcomes?

- Core beliefs
- Level of understanding of healthcare information
- Socio-economic status, i.e. cost of gym membership, classes, kit
- Demographics: age, gender (males less likely to help-seeking; older people often more invested in their health)
- Personality differences
- Cultural factors

Discuss and Debate

(a) How can health psychology inform the design of health promotion campaigns?

Discuss and Debate

(b) How can health promotion campaigns successfully target hard to reach populations?
